Q. No.	Expected Answer / Value Points	Marks	Total Marks
Section A			
Set1,Q1 Set2,Q5 Set3,Q4	 [Award ½ mark if the student just writes that the field lines radiate outwards from a positive charge]	1	1
Set1,Q2 Set2,Q4 Set3,Q5	Convex lens OR Converging lens	1	1
Set1,Q3 Set2,Q2 Set3,Q1	A current is said to be wattless if the average power consumed over one complete cycle is zero. ***Alternatively,*** In a a.c. circuit containing pure inductor or pure capacitor the phase difference between voltage and current is $\pi/2$. Hence $\cos\phi = 0$ and no power is dissipated even though a current is flowing in the circuit. This current is referred as wattless current. ***Alternatively,*** The component of the current perpendicular to the applied voltage ($I_v \sin\phi$) does not contribute power in an LCR circuit. Hence it is referred as wattless current.	1	1
Set1,Q4 Set2,Q3 Set3,Q2	Repeaters are used to increase/extend the range of a communication system.	1	1
Set1,Q5 Set2,Q1 Set3,Q3	B has higher resistivity. ***Alternatively,*** B	1	1
Section B			
Set1,Q6 Set2,Q8 Set3,Q9	Formula ½ Ratio of the de-Broglie wavelengths 1 ½ De-Broglie wavelength $\lambda = \frac{h}{\sqrt{2mqV}}$ Ratio of de-Broglie wavelengths of deuterons and $\propto$ - particle $= \frac{\lambda_D}{\lambda_\propto} = \frac{\sqrt{2m_\propto q_\propto V}}{\sqrt{2m_d q_d V}}$ $= \frac{\sqrt{2\times 4m_p \times 2qV}}{\sqrt{2\times 2m_p \times q \times V}}$ $= 2$	½ ½ ½ ½	2

Set1,Q7 Set2,Q9 Set3,Q10	Identifying the transitions ½ + ½ Calculating the ratio of shortest wavelengths 1 Lyman series - C and E Blamer Series – B and D Ratio of the shortest wavelength $\frac{\lambda_L}{\lambda_B} = \frac{3}{10} = 0.3$ ***Alternatively*** Ratio of the shortest wavelength $\frac{\lambda_L}{\lambda_B} = \frac{{n_1}^2}{{n_2}^2} = \frac{1}{4}$ [Note: The student may write that Lyman and Balmer series are defined for the hydrogen atom and the given energy level values do not correspond to hydrogen. Hence one cannot identify the Lyman and Balmer series in the given case. Full credit may be given for this type of answer]	½ ½ 1	2
Set1,Q8 Set2,Q10 Set3,Q7	Determining the value of modulation Index 1 Value of μ when amplitude is zero ½ Reason for $\mu < 1$ ½ $A_c + A_m = 10\ V$ $A_c - A_m = 2\ V$ On solving we get Modulation Index $\mu = \frac{A_m}{A_c} = \frac{4}{6} = \frac{2}{3}$ If the value of minimum amplitude $A_c - A_m = 0,\ A_c = A_m = 5V$ Then $\mu = \frac{A_m}{A_c} = 1$ μ is kept less than one to avoid distortion.	½ ½ ½ ½	2
Set1,Q9 Set2,Q6 Set3,Q8	Diagram 1 Relation between refractive index and angle of the prism 1  A= r_1+ r_2 (Here r_2=0)	1	

	$A = r_1$ Refractive index of the material is $\mu = \frac{\sin i}{\sin r} = \frac{\sin 2A}{\sin A}$ $(= 2\cos A)$	½ ½	2
	OR Image for the first lens ½ Formula for the second lens and substituting correct values ½ Calculating the distance between initial and final positions of the image 1 <u>For convex lens</u> u = - 40 cm , f = + 30 cm $\therefore \frac{1}{30} = \frac{1}{v} - \frac{1}{-40}$ ∴v = 120 cm <u>On introducing concave lens of focal length f = −50 cm</u> f = -50 cm , u= +(120-20) cm = +100 cm $\therefore \frac{1}{-50} = \frac{1}{v} - \frac{1}{100}$ $\therefore \frac{1}{v} = \frac{1}{100} - \frac{1}{50} = -\frac{1}{100}$ $\therefore v = -100$ cm Change in the position of the image = 200 cm to the left of its original position.	½ ½ ½ ½	2
Set1,Q10 Set2,Q7 Set3,Q6	Calculation of potential gradient 1 Calculation of unknown resistance R 1 Current through the wire $I = \frac{E}{R+r}$ $= \frac{2}{R+15}$ $\therefore$ Potential gradient = $\left(\frac{2}{R+15}\right) \times \frac{15}{100}$ Now E_2= Potential drop across 30 cm $\therefore 75 \times 10^{-3} = \left(\frac{2}{R+15}\right) \times 0.15 \times 30$ $\therefore R = 105\ \Omega$	½ ½ ½ ½	2

Section C			
Set1,Q11 Set2,Q20 Set3,Q17	Formulae 1 Calculating energy loss 1 ½ Source of energy loss ½ We have, energy stored = $\frac{1}{2}\frac{Q}{C^2}$ and Equivalent Capacitance = $C_1 + C_2$ =(600+300) pF Charge on the capacitor = Q = $600 \times 200 \times 10^{-12}$ = 12×10^{-8} C Initial Energy = $\frac{1}{2}\frac{Q^2}{C} = \frac{1}{2}\frac{Q^2}{600\times10^{-12}}$ Final Energy = $\frac{1}{2}\frac{Q^2}{900\times10^{-12}}$ Loss in energy $= \frac{1}{2}\frac{144\times10^{-16}}{10^{-12}}\left[\frac{1}{600} - \frac{1}{900}\right]$ = 4×10^{-6} J The source of energy loss is the energy converted into heat due to sharing of charge between the two capacitors. (Also accept: heat produced) [Alternatively: Also accept if the student calculates directly.]	½ ½ ½ ½ ½ ½	3
Set1,Q12 Set2,Q21 Set3,Q18	Production of i) microwaves ½ ii) infrared waves ½ Two uses of each wave (½+½) × 2 i) Microwaves are produced by special vacuum tubes called Klystrons / Magnetrons / Gun diodes / Point contact diodes. <u>(any one)</u> Uses: Radar system, Ovens, Communication <u>(any two)</u> ii) Infrared waves are produced by vibration of atoms and hot bodies. Uses: Physical therapy, remote switches in household electronic systems, detectors in earth satellites <u>(any two)</u>	½ ½ + ½ ½ ½ + ½	3
Set1,Q13 Set2,Q22 Set3,Q19	Drawing circuit diagrams of a p - n junction diode in i) forward bias ½ ii) reverse bias ½ Drawing the characteristic curves ½ + ½ Describing the terms minority carrier injection and break down voltage ½ + ½		

	 a) Forward bias	½	
	 b) Reverse bias	½	
	 	1	
	(i) During forward bias majority carriers (electrons) enter from n to p side which are actually minority carriers in p. This is called minority carrier injection. ***Alternatively*** Majority carriers holes enter from p side and enter into n side	½	
	(ii) At very high reverse bias voltage, the current suddenly increases. This voltage is called breakdown voltage. ***Alternatively*** It is the critical voltage in reverse bias at which current is independent of applied voltage.	½	3
Set1,Q14 Set2,Q11 Set3,Q20	(a) Description of elementary process — 1 Equation for V_{max}^2 — 1 (b) Expression for Planck's constant — ½ Expression for work function — ½		

(a) According to Einstein, packets of energy called photons, which are absorbed completely by electrons. This absorbed energy is used to eject the electron and also provide kinetic energy to the emitted electron. 1

(b) i) $\frac{1}{2}\ m\, V_{max}^2 = h\nu - \phi_0$ ½

$$\therefore\ V_{max}^2 = \left(\frac{2h}{m}\right)\nu - \left(\frac{2\phi_0}{m}\right)$$ ½

Slope $= \frac{2h}{m} = \frac{l}{n}$

$$\therefore h = \frac{m\,l}{2\,n}$$ ½

Intercept $= \frac{2\,\phi_0}{m} = l$

$$\therefore\ \phi_0 = \frac{ml}{2}$$ ½

<tr><td></td><td>
A charged particle can be accelerated to very high energy by subjecting it to an oscillating electric field applied between the dees. When the charged particle is subjected to a uniform magnetic field, it moves in a circular path. Both the fields are perpendicular to each other. The time for one revolution of the charged particle is independent of its speed or radius of its orbit.
$$Bqv = \frac{mv^2}{r}$$

Set1,Q20 Set2,Q19 Set3,Q22	Diagram ½ Explanation 1 Graph ½ Understanding graph using Malus' law 1 	½	

	When light from an ordinary source passes through a polaroid sheet P_1, its intensity is reduced by half. When the second polaroid (identical to the first one) is rotated with respect to the first one, the intensity of the light transmitted by the second polaroid varies from zero to maximum.  According to Mauls's law when the angle between the two polaroids is θ , the intensity of the transmitted light by the second polaroid is given by the relation $$I = I_o cos^2\theta$$ As θ keep on changes, intensity of the transmitted light by the second polaroid changes.	½ 1 1	3
Set1,Q21 Set2,Q14 Set3,Q11	(a) Calculation of current — 1 (b) Voltage across resistor and capacitor — ½ + ½ Paradox and its resolution — ½ + ½ (a) Current in the circuit $$I = \frac{V}{\sqrt{R^2 + \left(\frac{1}{C\omega}\right)^2}}$$ $$I = \frac{220}{\sqrt{100^2 + \left(\frac{1}{\frac{100}{\pi} \times 10^{-6} \times 2\pi \times 50}\right)^2}}$$ $$= \frac{2.2}{\sqrt{2}}\ \mathrm{A} = 1.55\ \mathrm{A}$$ (b) Voltage across the resistor = 100×1.55 V $= 155$ volt Voltage across the capacitor = 100×1.55 V $= 155$ volt Yes The sum of the two voltages is greater than 220 V but the voltage across the resistor and the capacitor are not in phase.	½ ½ ½ ½ ½ ½	3
Set1,Q22 Set2,Q15 Set3,Q12	Explanation of drift of electrons — 1 Definition — ½ Showing $\vec{j} = \sigma\,\vec{E}$ — 1 ½		

	When metal conductor is subjected to a certain potential the electron get accelerated due to electric field. Each electron experiences acceleration for an average time, τ, called the relaxation time. It then undergoes a collision and its velocity again becomes random. The average(drift) velocity of all the electrons contributes to the flow of current. The average velocity of electrons, acquired through their acceleration for a time τ is called drift velocity. $v_d = \frac{eE}{m}\tau$ Current density $j = \frac{I}{A}$ $= \frac{neAv_d}{A}$ $= ne\left\{\frac{eE}{m}\tau\right\}$ $= \left(\frac{ne^2\tau}{m}\right)E$ $\therefore \vec{j} = \sigma\,\vec{E}$	1 ½ ½ ½ ½	3
Section D			
Set1,Q23 Set2,Q23 Set3,Q23	The qualities displayed by Deepika, Ruchika and the teacher 2 Principle of galvanometer 1 Shape of the magnets and why is it so designed 1 a) The values displayed by Deepika and Ruchika are their inquisitiveness for practical knowledge. The teacher displayed concern for the students. b) Principle: When a current passes through a coil, placed in a uniform magnetic field, it experiences a torque. c) The pole pieces of the magnet are given a concave shape. This is done to produce a radial magnetic field.	1 1 1 ½ ½	4
Section E			
Set1,Q24 Set2,Q25 Set3,Q26	Flux through the flat faces 1 ½ Flux through the curved surface 1 Net flux 1 The charge inside the cylinder 1 ½ (i) Flux $= \int \vec{E}.\overrightarrow{ds}$ Flux through the flat surface on the: i. right side = $E_o.\pi\, r^2$ (outwards) ii. left side = $E_o.\pi\, r^2$ (outwards)	½ ½ ½	

	(ii) Flux through the curved surface = 0	½	
	[As electric field and area vector are perpendicular to each other]	½	
	Net outward flux $= \pi r^2 E_o + \pi r^2 E_o + 0 = 2\pi r^2 E_o$	1	
	Charge inside the cylinder = Net flux × ε_o	½

	$= 2\pi \varepsilon_o r^2 E_o$	½	5
	OR		
	Electric field outside the plates — ½ + ½ Electric field between the plates — ½ Capacitance Expression — 1 ½ Effect on electric field on introducing the dielectric — 1 Effect on Capacitance with dielectric — 1		
	(a) Calculation of electric field		
	(i) Electric field outside the plates: $\frac{\sigma}{2\varepsilon_0} + \frac{(-\sigma)}{2\varepsilon_0} = 0$ on both the sides of the capacitor.	½ + ½	
	(ii) Electric fields between the two plates		
	due to the left plate = $\frac{\sigma}{2\varepsilon_0}$ towards right		
	due to the right plate = $\frac{\sigma}{2\varepsilon_0}$ towards right		
	∴ Net Electric field = $\frac{\sigma}{\varepsilon_0}$ (towards right)	½	
	Capacitance , C = $\frac{Q}{V}$	½	
	$= \frac{Q}{Ed} = \frac{\sigma A}{(\frac{\sigma d}{\varepsilon_0})}$	½	
	$= \varepsilon_0 A/d$	½	
	(b) (i) When a dielectric slab is introduced, the Electric field decreases to $\frac{E}{K} = \frac{\sigma}{K\varepsilon_0}$ where K is the dielectric constant. This is because of the (oppositely directed) field due to the polarized dielectric.	1	
	(ii) Capacitance with dielectric increases by a factor K because the electric field (and hence p.d.) decreases by a factor K.	1	5
Set1,Q25 Set2,Q26 Set3,Q24	(a) Main considerations — 1 + 1 (b) Ray diagram — 1 Magnifying Power — 1 (c) Advantages (any two) — ½ + ½		

	a) Better Light gathering power and higher resolving power	1 + 1	
	b) 	1	
	Magnifying power of the telescope is the ratio of the angle subtended at the eye by the final image to the angle subtended by the object at the lens or the eye. [Also accept if the student just writes $m = \frac{f_o}{f_e}$]	1	
	1) Larger objective size 2) No spherical aberration, 3) No chromatic aberration, 4) More light gathering power 5) Mounting and polishing is easier 6) More economical [any two points]	½ + ½	5
	OR (a) Diagram — 2 (b) Minimum separation — 1½ Relation with resolving power — ½ Factors by which resolving power can be increased — 1		
	(a) 	2	

	[Also accept if the student draws the following diagram]  (b) S = Size of image of a point object in the image plane = $\nu\left(\frac{1.22\,\lambda}{d}\right)$ Minimum separation between two distinctly seen points in the object plane = $\frac{S}{Magnifying\ Power}$ $= \frac{S}{(\frac{\nu}{f})} = \frac{1.22\,f\,\lambda}{D}$ [Also give this mark if the student writes (i)Minimum separation = $\frac{1.22\,f\,\lambda}{D}$ Or (ii)Minimum separation equals the separation at which their images are just resolved Or (iii) Minimum separation corresponds to'limit of resolution'.] Resolving power $= \frac{1}{d} = \frac{2\mu\sin\theta}{1.22\,\lambda}$ [Also accept: Resolving power $\propto \frac{1}{(\text{minimum seperation})}$] Resolving power can be increased by (i) increasing the aperture of the objective (ii) using a medium with higher refractive index (iii) by decreasing the wavelength of the light used for illuminating the object [Any two]	½ 1 ½ 1	5
Set1,Q26 Set2,Q24 Set3,Q25	(a) Meaning of mutual inductance 1 (b) Expression for the mutual inductance of the arrangement 2 (c) Expression for the emf induced 2 (a) Consider two long co-axial solenoids. When a varying current flows through one coil, an induced emf is set up in the second coil due to the variation in the magnetic field associated with the second coil. This phenomena is known as mutual induction	1	

(b) Flux (φ_1) associated with S_1 when I_2 current flows through S_2 ½

$N_1\phi_1 = M_{12}I_2$ -----(1)

The magnetic field due to the current I_2 in S_2 is $\mu_o n_2 I_2$ ½

$\therefore\ N_1\phi_1 = (n_1 l)(\pi {r_1}^2)(\mu_o n_2 I_2)$

$= \mu_o n_1 n_2 \pi {r_1}^2\, l I_2$ ----(2)

From (1) and (2), we get 1

$$M_{12} = \mu_o n_1 n_2 \pi {r_1}^2\, l$$

(c) Induced emf in coil C_1 due to the change in current through C_2 ½

We have $N_1\phi_1 = MI_2$

For varying currents,

½

$$N_1\left(\frac{d\phi_1}{dt}\right) = M\left(\frac{dI_2}{dt}\right)$$

½

$\therefore$

$$-\varepsilon_1 = M\left(\frac{dI_2}{dt}\right)$$

½

or

$$\varepsilon_1 = -M\left(\frac{dI_2}{dt}\right)$$

5

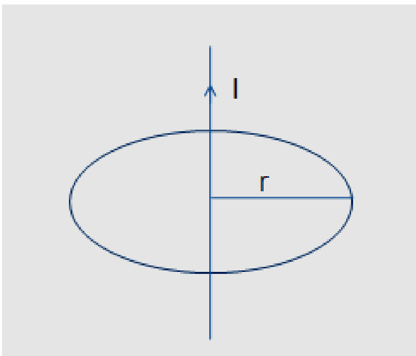
OR

(a) Statement of Ampere's circuital law	1
Derivation of magnetic field B	2
(b) Magnetic field inside the thick wire	1
outside the wire	½
Graph	½

(a) Ampere's Circuital law states that the line integral of the magnetic field, over a closed loop is equal to μ_o times the total current passing through the surface enclosed by the loop. 1

Alternatively, $\oint \vec{B}.\,\vec{dl} = \mu_o I$

Let an infinite straight wire carry a current I. We consider a circle of radius r, centered on the wire, and having its plane perpendicular to the wire.



½

By right hand rule, the magnetic field is tangential at every point of this circular loop.

	∴ By Ampere's circuital law,		
	$$\oint \vec{B}.\vec{dl} = B.2\pi r = \mu_0 I$$	1	
	$$\therefore B = \frac{\mu_0 I}{2\pi r}$$	½	
	(b) For r < a, we have $B.2\pi r = \mu_o I_{enclosed}$		
	$= \mu_o \left(\frac{\pi r^2}{\pi a^2}\right) I$	½	
	$= \frac{\mu_o r^2}{a^2} I$	½	
	$\therefore B = \frac{\mu_o}{2\pi} \frac{I}{a^2} r$		
	For r > a $B.2\pi r = \mu_0 I$		
	$or\ B = \frac{\mu_0 I}{2\pi r}$	½	
		½
